

DRA and VRA requirement

Bayer has previously proposed that drift reduction agents (DRA) and volatility reduction agents (VRA) be required for all XtendiMax applications. The uses rates of DRA vary by product but in the case of Intact®, a common guar gum-based DRA, the use rate is specified at 0.5% v/v. DRA prices vary by product but growers can typically expect to pay \$3-4/acre for DRA. VaporGrip Xtra VRA is used at a minimum rate of 20 oz/acre and the expected cost to the grower is ~\$2/acre. Bayer will make a meaningful effort to ensure that sufficient volume of VaporGrip Xtra is available to cover all potential Xtend crop acres sprayed with XtendiMax

Training Materials

2020 XtendiMax Training materials are provided below for reference. 2021 training materials will be updated upon approval of the final product label to reflect updated label requirements, including use instructions and mitigation measures. Additionally, 2021 training materials will be updated to change the company name from Monsanto Company to Bayer CropScience LP and will have a different theme (e.g., background colors, pictures, etc.) to clearly differentiate 2021 training materials from training materials from previous years.
